

DISCOVERY → BUILD BRIEF

Discovery Call, typed to the build.

The field-side companion to the discovery script. Every answer is captured as the exact variable a formula reads, so the call output drops straight into the build brief, no translation step.

Revised 30 June 2026 · paired with the AE discovery script and the client dashboard build brief

Rosebud Solutions · Internal sales enablement · Discovery → Build Capture

AE · technical

How this sheet works

The sell-side script produces a story and one confident number. This sheet produces **typed variables**. The build consumes per-workflow inputs, never an aggregate, so each question below is annotated with the symbol it produces, its unit, its constraint, and its **source class**. A captured field is only useful to the build if it carries a class.

D

D discovery-locked → becomes a build variable

B

B build-set → engineer fixes after the call

L

L logs → fills from live data post go-live

C

C client-owned → never measured by us

COMPUTED OUTPUT 1 · HOURS BACK (CLIENT-FACING)

Hours_back = sum_w [(V_success_w · M_w · C_w) - (V_flagged_w · M_flag_w)] / 60

Discovery owns exactly one symbol: **M_w**, the owner's minutes per task instance, per workflow, held ~20% conservative and locked on a per-task yes. **V_success_w** / **V_flagged_w** come from logs (L); **C_w** completeness and **M_flag_w** are build-set (B). Run per workflow, never as a lump: a negative per-workflow term is the signal that a workflow is not yet earning its oversight.

COMPUTED OUTPUT 2 · PRICE

Rev_m = u_val × u_pm | Tier = max(tier(Rev_m), tier(headcount))

SetupFee = fixed(Tier) | Retainer = PartA(scope) + PartB(band(u_pm)) + PartC(0.02 × Rev_m, cap £40k) ; floor £2,500

Every input here is a discovery-locked field: **u_val**, **u_pm** → **Rev_m** (Q11), **headcount** (setter brief), **scope** = the three confirmed pains (Q2 + reflect). Tier takes whichever signal points higher.

ASK a question, in your words. **SAY** close to word-for-word. **CORE** protect if the call runs short. **NEW** not in the sell-side script.

The questions, typed

I

ASKCORE

"Walk me through a normal Tuesday, start to finish. Where does it start, and what's the last thing you do before you log off?"

PRODUCES

Task inventory → the in-scope workflows **w[]**; the unit-of-work word **word_unit** **D**

CONSTRAINT

Capture only tasks the build removes. The last thing before log-off is usually the bottleneck.

FEEDS

Selects the vertical's primary three (Appendix A) → **Hours_back** terms + Engine nodes

2

ASKCORE

"And one that was painful. What was actually getting in the way? ... Where did it stall?"

PRODUCES

Primary leak → confirms which **w** are in scope; **word_unit** / **word_appt** heard live **D**

CONSTRAINT

Don't name the problem. Stay silent after asking; the leak surfaces in the pause.

FEEDS

scope (the three pains) → Part A retainer + the reflect-value beat

3

ASKCORE

"You came back to [the chasing / the end-of-day catch-up] a couple of times, say more about that?"

PRODUCES

Ownership transfer. No symbol; this is the tone-shift that makes the pain theirs.

CONSTRAINT

Hand it back in their words, never as a claim.

FEEDS

Gates the reflect-the-value beat. Feeds no tile.

4

ASKCORE

"Last week, Monday to Friday: roughly how long on [task 1], and how many of those did you handle?"

PRODUCES

m₁ minutes per instance · **v₁** instances per week **D**

CONSTRAINT

Two numbers per task, not one. Anchor to last week. Never suggest a number.

FEEDS

M₁ (after conservatism) → **Hours_back**

5

ASKCORE

"And [task 2] — how long, and how many?"

PRODUCES

m₂ · **v₂** **D**

CONSTRAINT

The scattered one, most underestimated. Name the forms it takes so they count it.

FEEDS

M₂ → **Hours_back**

6

ASKCORE

"And [task 3] — same again, how long and how many?"

PRODUCES

m₃ · **v₃** **D**

CONSTRAINT

Last input before you sum. Spell it out so they price the part that feels like "just the job."

FEEDS

M₃ → **Hours_back**

SAY

SAYCORE

"So we're looking at around [H] hours a week on this, before anything else. Sound about right?" (range → say the midpoint back)

PRODUCES

Per-task **M_w** locked on the yes; roll-up **H** = **sum_w**(**m_w** · **v_w**) **D**

CONSTRAINT

Conservatise each **m_w** ~20%. The yes is what makes **M_w** theirs. Record the midpoint.

FEEDS

M_w → **Hours_back**. **H** is the sell-side aggregate, derived, not itself a build input.

7

ASKCORE

"Where can an enquiry actually reach you? Name every one — your site, each portal, each social, text, phone."

PRODUCES

chan[] — channel list, named **D**

CONSTRAINT

Platform names (Zillow, Rightmove, Instagram, SMS), not "online and phone." Include the quiet channels.

FEEDS

Captured tile · Lead sources panel · channel-health strip

8

ASK

CORE

"When a call comes in and nobody can grab it, what happens to that one right now?"

PRODUCES

`missed_call` — daytime overflow exists **D**

CONSTRAINT

This is the daytime miss (busy / on the tools).
Distinct from the after-hours one below.

FEEDS

Missed-call recovery source

9

ASK

CORE

NEW

"When do these actually come in — evenings, weekends, after you've shut the laptop? What happens to a 9pm one now? And what hours are you open?"

PRODUCES

`[t_open, t_close] + days_open; after_hours` **D**

CONSTRAINT

REQUIRED. Without the open/close boundary the after-hours partition is undefined, and this is the tile you open the demo on.

FEEDS

Answered-after-hours partition · overnight panel · the "nothing to voicemail" half of Standard

IO

ASK

CORE

"And what are you running to manage all this — the CRM or system the team actually lives in, by name?"

PRODUCES

`sys` — exact product name **D**

CONSTRAINT

The product ("Follow Up Boss," "Encompass"), not "a CRM." Ten seconds; naming, not integrating.

FEEDS

CRM-sync node label

II

ASK

CORE

Value read, built in order: "You're placing around ten a month — what's one worth when it lands?" → real same-niche comparator → "Ten at a thousand, ~£10k/mo from that line. Reflect your last couple of months?"

PRODUCES

`u_val` £/unit · `u_pm` units/mo → `Rev_m` = `u_val` × `u_pm` £/mo **D**

CONSTRAINT

Never ask revenue outright; build it from committed pieces. The comparator must be real and from their niche. Confirm `Rev_m` back.

FEEDS

`Tier` (max with headcount) + Part C retainer. The price anchor.

I2

ASK

"What makes an enquiry worth your time versus one you'd pass on?"

PRODUCES

0 ruleset {fields, cut, bands} + `route_map` **D** → **B**

CONSTRAINT

Shape on the call; HARDEN in the 3-day build window (explicit handoff). Fields + thresholds, not every edge case.

FEEDS

`Qualified` = `count( score(lead,0) ≥ cut )` · routing

I3

ASK

"How does a [appointment] actually get set right now — whose calendar, and how are reschedules handled?"

PRODUCES

`word_appt`; `calendar_owner`; `reschedule_flow` **D**

CONSTRAINT

Use and record their appointment word (showing / viewing / consult / survey). Reschedules are where the pain hides.

FEEDS

Showing-booked tile label + Booking node

I4

ASK

"When does one of these go cold — after how long — and what would bring it back?"

PRODUCES

T_dormant window + trig condition D

CONSTRAINT

Land a concrete window and trigger (listing-match / renewal date / recall interval), not "it varies."

FEEDS

Nurture wake feed

I5

ASK

"How are confirmations and reminders handled today? What does your no-show situation look like?"

PRODUCES

cadence; no_show_words (qualitative) D

CONSTRAINT

Capture cadence. Do NOT record a no-show baseline number — you never claim a delta. Words only.

FEEDS

Reminders node (industry figure shown as benchmark, never their "before")

I6

ASK

"When a new one lands, who does it go to, and how do you split them?"

PRODUCES

staff[] + split D

CONSTRAINT

Actual first names. Doubles as quiet buyer-mapping.

FEEDS

Team activity · live feed "routed to [name]"

I6b

ASK

"How much of this actually runs through you — are you in it day to day, or has the team got it without you?"

PRODUCES

owner_dep D

CONSTRAINT

Pain signal + qualifier. An owner who IS the operation is your strongest reason to build.

FEEDS

Build justification. Feeds no tile.

I7

ASK

CORE

"How's the team set up day to day — who do you go to for what?"

PRODUCES

buyer_map D

CONSTRAINT

The order they name people is the hierarchy as they live it. You need everyone who holds a yes in the demo room.

FEEDS

Demo invite. Feeds no tile.

Removed from the sell-side script: Q1 (role) folds into Q1-Tuesday · Q3 (smooth story, feeds no cell) · Q11 (volume, lands after the hours yes and only feeds an illustrative tile) · Q20 (prior tools, a refinement of the buyer map).

Computed on the call · price

Q11 gives revenue, which confirms or lifts the setter’s headcount tier. Place by whichever signal points higher. Setup is fixed to the tier; the retainer is the flexible piece, seated as the three-number anchor and made exact for the demo. **Internal — never shown to the prospect.**

TIER	EST. MONTHLY REVENUE (REV_M)	HEADCOUNT	SETUP FEE
1	£5k – £20k	1 – 3	£5,000
2	£20k – £35k	3 – 6	£7,500
3	£35k – £50k	6 – 10	£10,000
4	£50k – £70k	10 – 20	£13,500
5	£70k – £100k	20 – 40	£17,500
6	£100k – £250k	40 – 75	£22,500
Enterprise	£250k+	75+	£35,000+ · escalate to Saj or Jay first

RETAINER · THREE-NUMBER ANCHOR (ROUGH ON CALL, EXACT AT DEMO)

Retainer = PartA(scope) + PartB(band(u_pm)) + PartC(0.02 × Rev_m, cap £40k/mo) ; absolute floor £2,500

Part A is scope-based (£2k–£7k). Part B is the volume/profile surcharge band off u_pm. Part C is 2% of gross monthly revenue, capped £40k/mo. The axis you voice is scope (high / middle / low), not volume.

Invariants

- **Capture m_w and v_w per task, never a lump.** You cannot recover per-workflow M_w from an aggregate, and per-workflow is mandatory — it is what lets the Ops auditor flag a workflow not earning its oversight.
- **One symbol is discovery’s on Hours back: M_w.** The V counts, completeness C, and M_flag are not yours to capture.
- **Named, not categorical.** Channels and system are product names (chan[], sys), or the tile builds generic.
- **Shape now, harden in build.** The ruleset 0 leaves the call at shape-fidelity; fields and thresholds are hardened in the three-day window. Make that handoff explicit.
- **Never capture a baseline you will later claim a delta against.** Response speed and no-show are forward standards, not measured before. Words only.
- **Never compute conversion.** Showing-completed and offer-made stay blank — class C, the client’s to measure, never ours.
- **Conservatise M_w ~20%.** The per-task “yes” is what locks it and makes the number theirs, not flattering.
